替换策略

LRU替换策略:

- 将被访问的数据放在头部
- 将最长时间未被访问的数据置换

```
44,46d43
     if data[2] == 0:
         return
     data = data[0]
63c60,61
    index = list(cache.keys())[0]
<
     from random import choice
     index = choice(list(cache.keys()))
86,89c84
<
         cache[index] = [block, 0, 0]
     else:
<
         value = cache.pop(index)
<
        cache[index] = value
<
         cache[index] = block
91c86
   x = cache[index][0][offset]
    x = cache[index][offset]
106,109c101
         cache[index] = [block, 0, 0]
<
     else:
<
        value = cache.pop(index)
<
        cache[index] = value
<
___
         cache[index] = block
>
111,112c103
     cache[index][0][offset] = data
<
     cache[index][2] = 1
<
     cache[index][offset] = data
```

结果:

Random9.61 -> FIFO9.64 -> LRU9.74

```
Pass Correctness Check!
```

总共访存量为337.5MiB,在这过程中与主存交互字节数7.187MiB,如果不使用cache,共需与主存交互2.6376iB字节数据! 总共访问cache 11059200次,总共访问主存29436次,假设主存的访问时间为cache的10倍,则整体访存效率提高了9.74倍!

写回修改

增加dirty位。

结果:

无dirty9.74 -> 有dirty9.75

Pass Correctness Check!

总共访存量为337.5MiB,在这过程中与主存交互字节数6.968MiB,如果不使用cache,共需与主存交互2.637GiB字节数据!总共访问cache 11059200次,总共访问主存28542次,假设主存的访问时间为cache的10倍,则整体访存效率提高了9.75倍
